FinTrack- Finance Tracker Website

MAJOR PROJECT-II

Even Semester

Session 2025-26

Presented by

Nitin Gangwar (202410116100136)

Paras Chandravanshi (202410116100140)

Neha Agnihotri (202410116100131)

Rishabh Singh Bhadauriya (202410116100166)

Project Supervisor

Dr. Amit Kumar

Assistant Professor

FinTrack

Your Personal Finance Intelligence Platform

A Python-powered web application that helps you track, visualize, and predict your financial future — with an AI chatbot that gives personalized advice.

The Problem We're Solving

Objective

Empower individuals to take control of their finances through intuitive tracking, smart visualization, and AI-driven insights — all in one place.

The Problem

Most people lack a clear picture of their spending habits. Manual tracking is tedious, existing tools are either too complex or too basic, and no one gets personalized financial guidance.

The Solution

FinTrack combines expense tracking, interactive charts, ML-based expense prediction, and an AI chatbot (SyncBot) into a single, seamless Streamlit application.

What Makes Us Different

Most finance apps show you where your money went. FinTrack tells you where it's going — and how to do better.

ML-Powered Predictions

Forecast next month's expenses using your own historical spending data — not generic benchmarks.

SyncBot AI Advisor

A Cohere-powered chatbot that reads your transaction history and gives personalized financial advice.

Zero Setup, Instant Use

Built on Streamlit — no complex installs. Open the browser and start tracking in seconds.

Lightweight & Private

SQLite backend keeps your data local and secure — no third-party cloud dependency.

Technologies Used

Python

Core backend logic, data processing, and ML model integration.

Streamlit

Rapid web app framework — turns Python scripts into interactive UIs instantly.

SQLite

Lightweight, serverless database for storing user transactions and sessions.

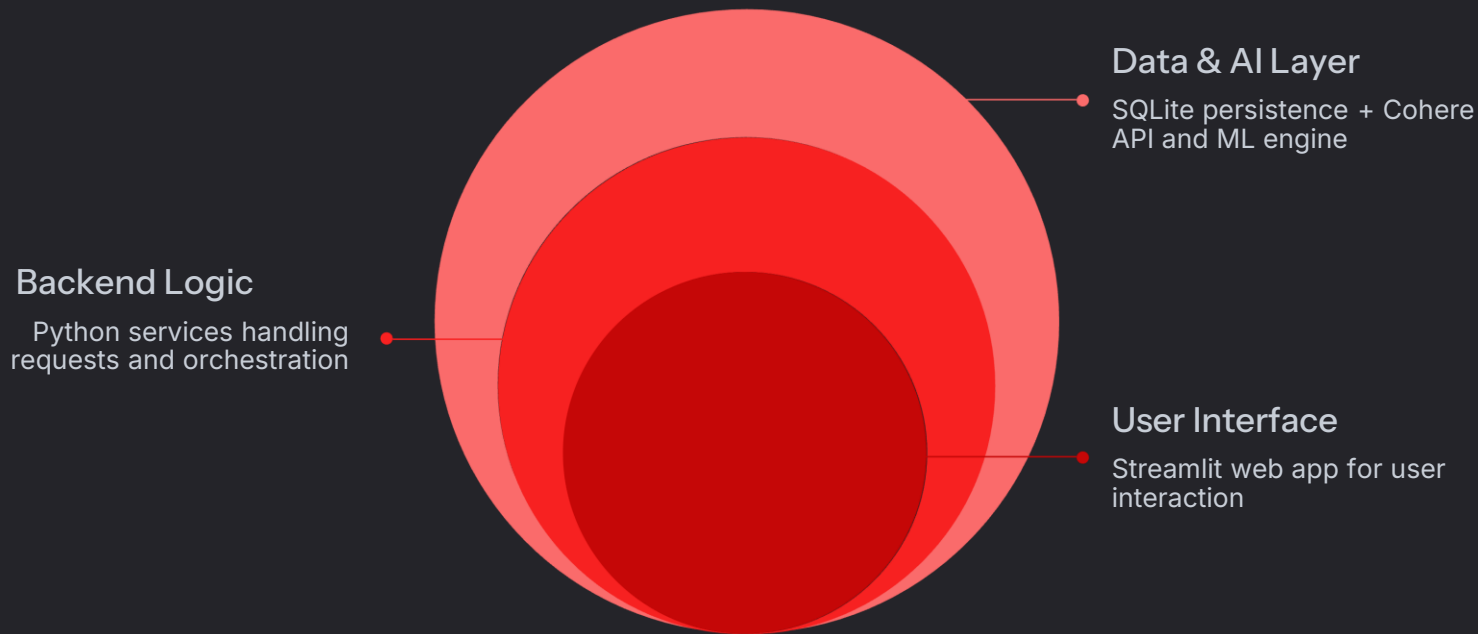

Cohere API

Powers SyncBot, the AI financial advisor, with natural language understanding.

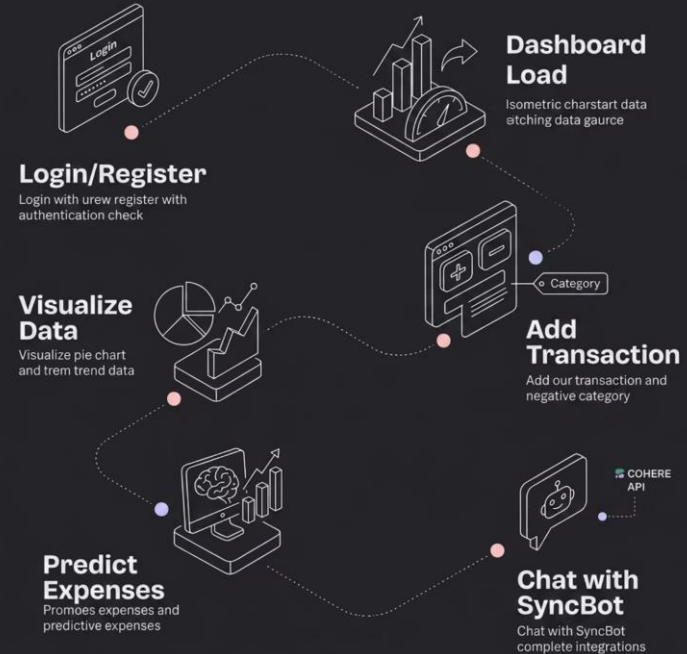

System Architecture

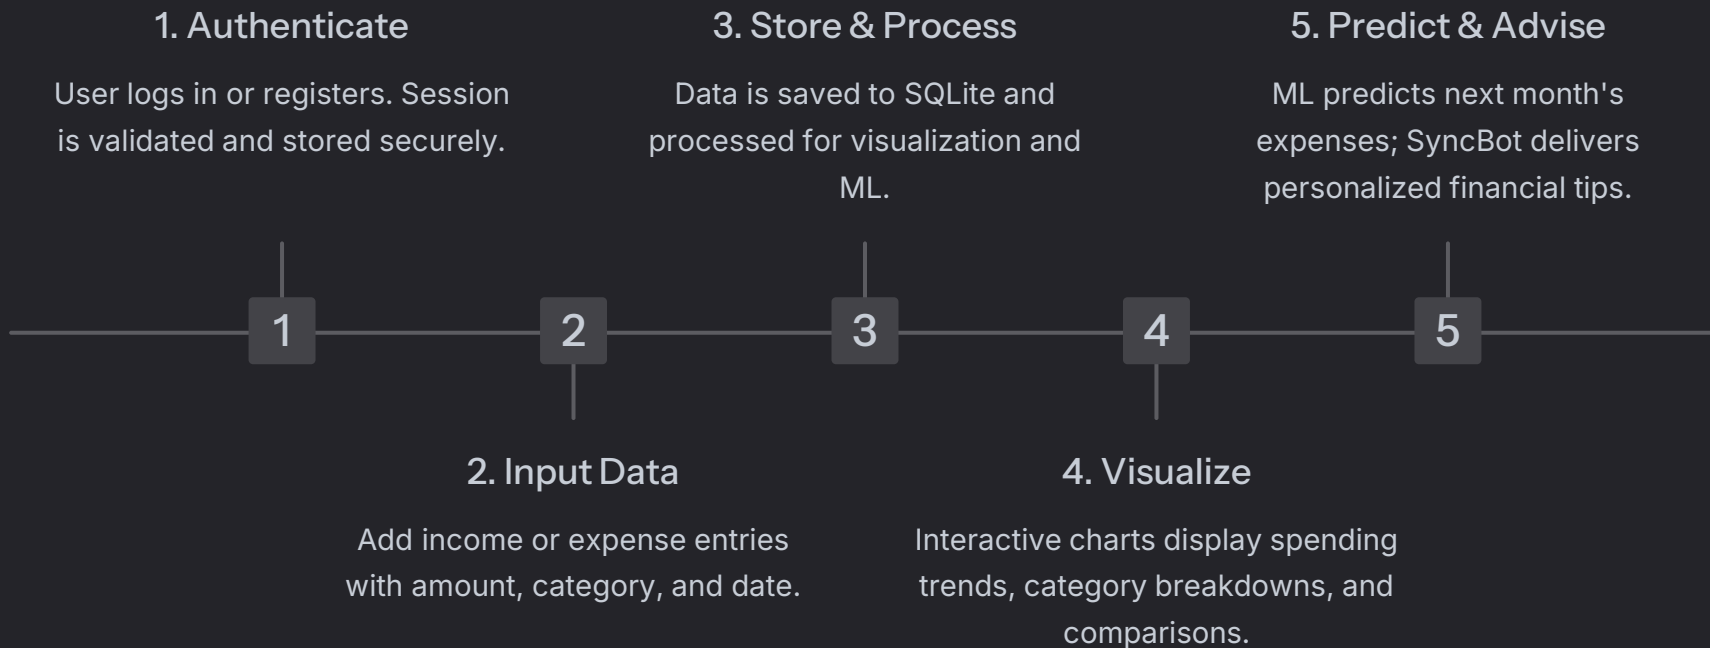

FinTrack follows a clean layered architecture. The Streamlit frontend communicates with Python backend logic, which manages data persistence in SQLite and orchestrates AI services — including the Cohere-powered SyncBot and the expense prediction model.

System Flowchart

Every user interaction follows a structured flow — from secure authentication through real-time data visualization and AI-powered insights. The system ensures data integrity at every step while keeping the experience seamless.

Hi paras123! How can I help you today

Enter your question:

Predict my next month expenses

Send ▶

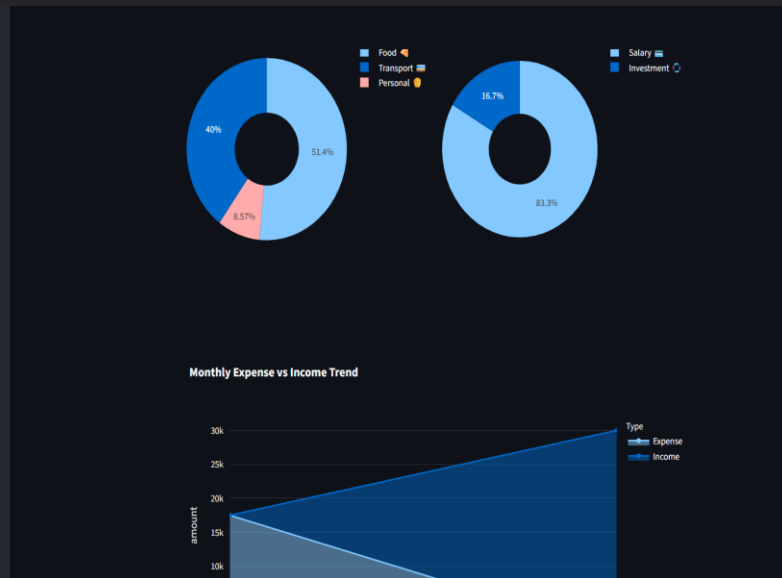

To predict your next month's expenses, I'll analyze the provided transactions and make assumptions based on the patterns observed. Here's a breakdown of the expenses and a prediction for the next month:

Current Month Expenses (March 2026):

1. Rashan (Food): ₹8,000
2. Electricity (Personal): ₹1,500
3. Gas (Food): ₹1,000
4. Travel (Transport): ₹7,000

Total Expenses: ₹17,500

Assumptions for Next Month (April 2026):

Future Scope & Conclusion

Future Roadmap

- **Multi-currency & international support** for global users
- **Bank API integration** for automatic transaction imports
- **Budget alerts & notifications** via email or SMS
- **Mobile app version** built with Flutter or React Native

Conclusion

FinTrack demonstrates how modern Python tools — Streamlit, SQLite, and Cohere AI — can be combined to build a powerful, intelligent personal finance platform. It's more than a tracker; it's a financial companion that learns from your behavior and guides your decisions.

**Built with purpose. Designed for clarity.
